Although the idea of TUX2 is a technologically feasible and practical concept, the barriers to entry in the wheelchair market and current strain on the health care system make bringing the product to market impractical and unprofitable. The process of FDA approval would be expensive and extremely difficult if even possible, requiring an enormous amount of dedication. This endeavor would also have the opportunity cost of preventing me from pursuing more profitable endeavors. For these reasons, I have decided that it is not in my best interest to try and continue this project after graduation.
